First-flood grid validation: run 11, day 20

Full 72 km × 48 km domain; end-flood rasters precede migration and remapping

A = 0 m/flood, C = 0.003, E = 1; channel-node spacing = 250 m in both cases

Gray: active channel (a, b, d, e); excluded channel-containing blocks (c, f)

White in deposit maps (d, e): less than 0.000001 m

Common floodplain: 3384 km²; average each fine 2 × 2 block; retain dry cells.

Mean absolute differences: depth 0.100738 m; deposit 0.000298 m. Symmetric-log linear core: ±0.0001 m.

Independent validation diagnostic — not a manuscript panel or evidence of grid/time convergence.
